

Advance DevOps

Experiment 1a

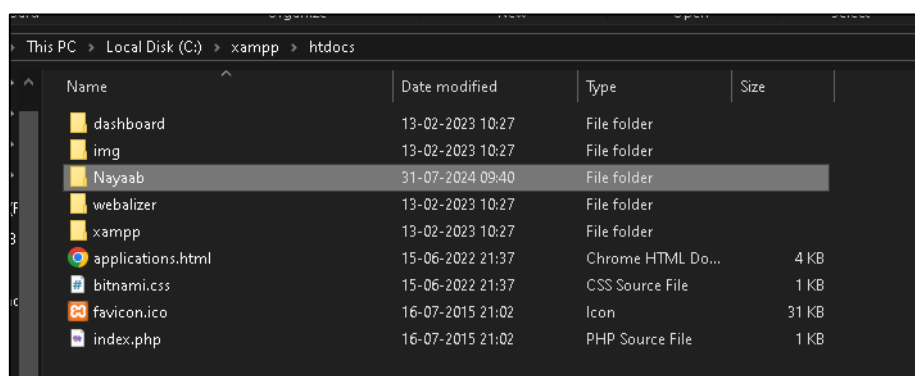

Part 1: To develop a website and host it on your local machine on a VM

Following are the steps to be followed:

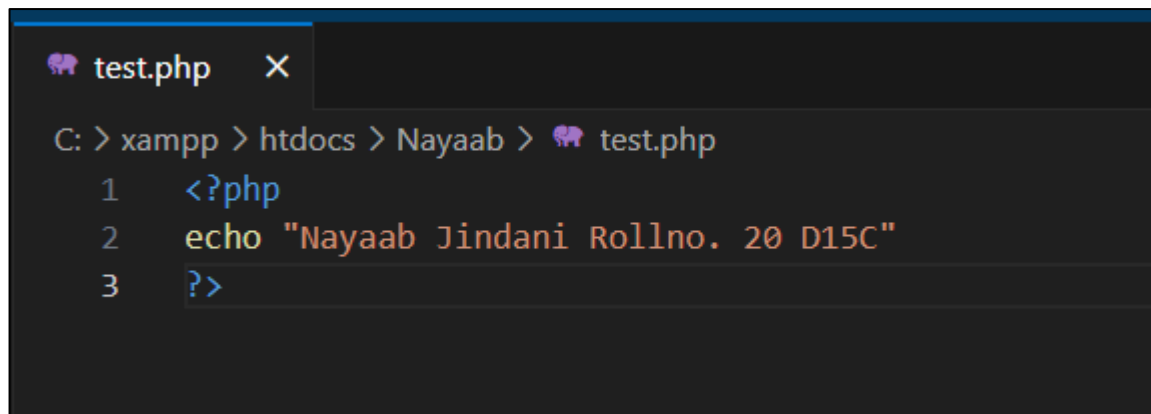

1. First step is to download XAMPP through the official website, <https://www.apachefriends.org/download.html> and then complete the installation process.

2. To run a php script go to C:\xampp\htdocs and create a folder (here my folder is named Nayaab).

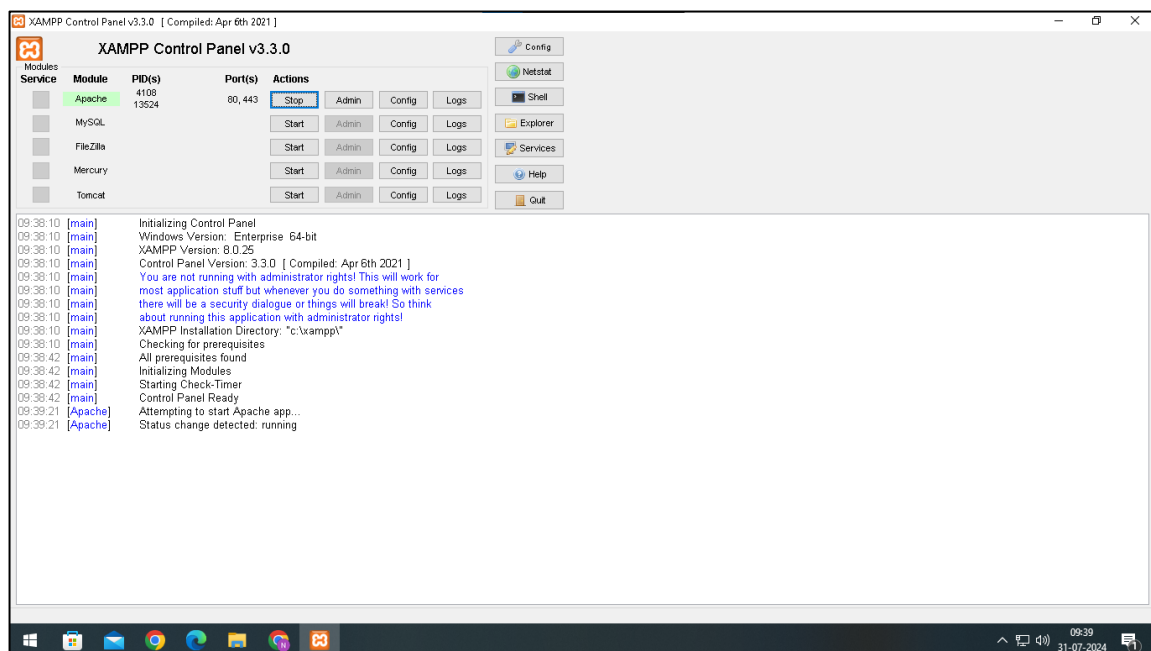

3. Inside the folder create a file and save it as filename.php and write php script inside this file.

The screenshot shows a code editor with a dark theme. At the top, a tab is labeled 'test.php' with a purple elephant icon and a close button. The editor content shows a command prompt session where the user navigates to 'C:\> xampp > htdocs > Nayaab >' and then creates a file named 'test.php'. The file content is as follows:

```
1 <?php
2 echo "Nayaab Jindani Rollno. 20 D15C"
3 ?>
```

4. Now go to XAMPP control panel and start Apache server.

5. Now type `http://localhost/folder_name/filename.php` in your browser and you will get to see the output.
